# Download

Working Model 3D is a 3D dynamics simulation program for Windows 3.11, 95 and NT. This requires a 486/66 processor and 8 MB of RAM with a Pentium processor and 16 MB. The new node-based workflow also gives you maximum flexibility in how you work. All programs that support node-based workflow are designed to make development interactive. To do this, they use a graphical user interface (GUI) that provides quick access to menus and other services. This format provides interactivity by including a graphical user interface in the process. You only use your workstation for editing and sharing.
